A scrutiny of the introduction

By JON F. CLAERBOUT

Stanford, California

Abstract

The introduction to a technical paper should be an invitation to readers to invest their time reading it. Typically this invitation has three parts (1) the review, (2) the claim, and (3) the agenda. In the claim, the author should say why the paper’s agenda is a worthwhile extension of its historical review. Personal pronouns should be used in the claim and anywhere else the author expresses judgment, opinion, or choice.

Introduction

Throughout the years, I have participated in reading committees of more than a hundred doctoral dissertations. Additionally, reports of the Stanford Exploration Project contain about 60 papers a year, and I am nominally in charge of making them presentable. In all this activity, I have seen many poor abstracts and, in each case, I have spared myself and the author much struggle by referring to the short paper A scrutiny of the abstract by Kenneth Landes (AAPG Bulletin 1966, 1990), which was formerly distributed by the SEG to all its aspiring authors. I rarely rewrite authors’ abstracts any more—it’s usually enough to have them read Landes’ paper and rewrite it themselves. Landes’ own abstract is worth quoting:

The abstract is of the utmost importance, for it is read by 10 to 100 times more people than hear or read the entire article. It should not be a mere recital of subjects covered. Expressions such as “is discussed” and “is described” should never be included. The abstract should be a condensation and concentration of the essential information in the paper.

Introductions are not easy to write either. I am pleased to report that in recent years, I have developed a formula for the introduction. With this paper expounding my formula, I am hoping to reduce the need for one-on-one tutoring. You might be able to produce a good introduction without following my formula but if you have trouble producing one that pleases other people (and you would like to finish it and get on with your life), then I suggest you follow my formula.

First, I describe the three essential parts of an introduction and then I offer some tips on overall organization. You will see why introductions are so difficult to write once you understand how introductions depend on that most embarrassing of all words, “I.”

The body of an introduction

My formula for an introduction is a sequence of three parts. They are (1) the review, (2) the claim, and (3) the agenda.

The review. Pick out about 3-10 papers providing a background to your research and say something about each of them. You could paraphrase a sentence or two from each abstract. The review is not intended to be a historical review going back to Newton or Descartes. Try to find a few papers by your office mates, your advisor, your predecessors, or other associates. That way you might find somebody to give you helpful criticism!

Anyone can follow these instructions and write a review that looks presentable. Where intelligence and skill are required is in organizing the review so that it leads up to something, namely your claim.

The claim. The most important part of the introduction is buried in the middle. It is the claim. The claim is where you claim your work is a worthwhile extension of the review you just wrote. If someone says your writing is “unmotivated,” they aren’t insulting your humanity, it just means they can’t find your claim.

In your claim, you should use the personal pronoun “I” (or “we” if you aren’t the sole author). The word “I” tells people where common knowledge runs out and your ideas begin. If you are writing a doctoral dissertation or an article for a refereed journal, then you should be making a new contribution to existing knowledge. Your paper is not acceptable without an identifiable claim.

Whether your ideas are solid as bedrock or speculative as clouds, you need first-person pronouns. Where your ideas are speculative, the pronouns signal a disclaimer. Where your ideas are solid, the pronouns signal that you may be credited for them. When your friends see your personal pronouns, they will know just where they should offer their questions and suggestions.

You may use personal pronouns elsewhere in your paper, too. Generally, you should use a personal pronoun whenever you are expressing an opinion or exercising judgment. Another time to use “I” is whenever there is a simple matter of choice. For example, “To test the theory, I selected some data,” or “To examine the theory, I programmed the equations,” or “To evaluate the hypothesis, I made some synthetic seismograms.”

Good scientific papers contain many types of statements ranging from ancient axioms to common knowledge to speculations (Scrutiny continued on p. 41)
and outright guesses. It is the writer's fault if a casual reader cannot
distinguish these types of statements. Personal pronouns are
good words to keep the distinctions clear. Other good words for
this purpose are "should, could, would, might, may, can, is,
does..." Use them all and pick the best for each purpose.

Some editors of scientific papers mechanically introduce the
personal pronoun "I" to avoid the passive voice. I don't agree
with them. For example, such editors will change "Substitution
of equation (1) into equation (2) gives..." into "Substituting equa-
tion (1) into equation (2), I find..." The first wording states a
simple fact but the second wording hints that someone else might
get a different result.

The agenda. An agenda is found at the end of many introduc-
tions. It summarizes what you will show the reader as your paper
progresses. Your agenda will be dull if it is merely a recital of the
topics you will cover. Instead, it should tell how your paper works
to fulfill your claim. In this way, your agenda should clarify your
claim.

The agenda is not as important as the review and the claim. Keep it short.

Occasionally, you will be fortunate enough to be writing about
something in which some of your conclusions can be made in
simple statements. If so, state them early, right after your agen-
da. You aren't trying to write a mystery! Many more people will
begin reading your paper than will finish reading it. Motivate them
to finish! Unfortunately, many technical papers do not lend them-
theses to early conclusions.

After the introduction

Of course, you want people to read beyond your introduction,
too. So think carefully about the order of your material and how
you say things. (Notice this tiny paragraph is a small abstract of
what follows.)

Order of material. You could write your paper so that each
part builds on earlier parts. Like the axiomatic approach to
topology, you could refuse to refer to things not yet proven. But,
rather than write your paper that way, it is wiser to maximize your
readership. Since many more people will begin your paper than
will plow through all the way to the end, try to state results before
you prove them. Put off complicated derivations and digressions
until the end. Complicated mathematical derivations, especially if
marginal to your main thesis, should be relegated to appendices.

What is central and what is peripheral? In your paper, you
might want to include digressions, possible applications, etc.
That's nice. But be sure to include language that labels them as
peripheral. If you don't, you may find people (and not just critics
and enemies) missing your main point.

Conclusion

This short article is not a typical technical paper, but you might
like to look back at the introduction to see if I follow my own
advice. ☺
