A tutorial-based users’
manual for Poly3D

Written by: Kate Griffin

Based on a Stanford University MS thesis written by program creator, Andrew Lyle Thomas, and web-based user interface created by Sadi Kose. Also includes an IRIS Explorer tutorial written by Juliet Crider.
Poly3D
A Tutorial-Based Users’ Manual for Poly3D

Written by:

Kate Griffin
Technical Communication Internship Project
University of Wisconsin - Madison
June 8, 1998

Based on a Stanford University MS thesis written
by program creator, Andrew Lyle Thomas,
and web-based user interface created by Sadi Kose
Also includes an IRIS Explorer tutorial written by Juliet Crider

The writing of this manual was supported by:

• National Science Foundation (Grant # EAR-97 06548 to M.L. Cooke)
• University of Wisconsin - Madison Graduate School
• University of Wisconsin - Madison Geological Engineering Program
Contents

Chapter 1: So You’ve Got Questions ................................................................. 2

What’s in This Manual? ................................................................. 3
Whom Should I Call?................................................................. 4
What are Numerical Modeling Tools? ........................................... 5
Why Should I Use Poly3D? ...................................................... 6
What BEM Programs are Available? ......................................... 9
What Can’t Poly3D Do? ............................................................ 9

Chapter 2: Getting Started With Poly3D .............................................................. 10

What Is Poly3D?...................................................................... 11
What Do I Need to Use Poly3D?............................................. 11
What Should I Do First? ....................................................... 12

Chapter 3: Poly3D Input Files ........................................................................ 13

Input File Basics .................................................................... 14
Sample Problem ................................................................... 15
STEP 1: Constants ................................................................ 16
STEP 2: User Coordinate Systems ........................................... 21
STEP 3: Observation Grids .................................................... 25
STEP 4: Object/Element/Vertices ........................................... 31

Chapter 4: Viewing Poly3D Output With IRIS Explorer .................................. 36

But I Know Nothing About IRIS Explorer! ......................... 37
Understanding Data Scribe .................................................. 39
Starting With IRIS Explorer .............................................. 45
A Quick Guide to Using the Render Model ......................... 50
Using Images in Other Applications ................................... 51
IRIS Explorer Information On-line ................................... 52

Appendix A: Useful Information .................................................................. 53

Displacement Discontinuities .............................................. 54
Half-space vs. Whole-space ................................................ 55
Remote Stresses ............................................................... 56
Tensors ........................................................................... 57

Index ....................................................................................... 58
